SHORT ANSWER. Write the word or phrase that best completes each statement or answers the question.

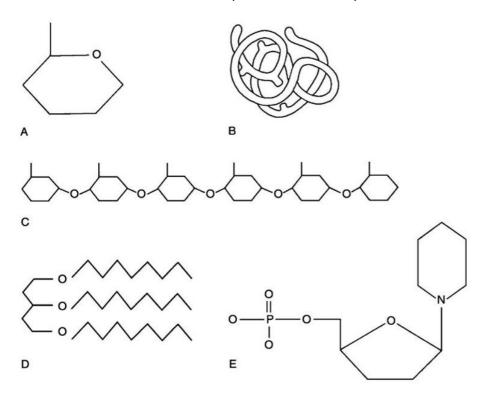

Figure 2.1

Using Figure 2.1, match the following:

1) Lipid.

Answer: D

2) Functional protein.

Answer: B

3) Nucleotide.

Answer: E

4) Polysaccharide.

Answer: C

5) Monosaccharide.

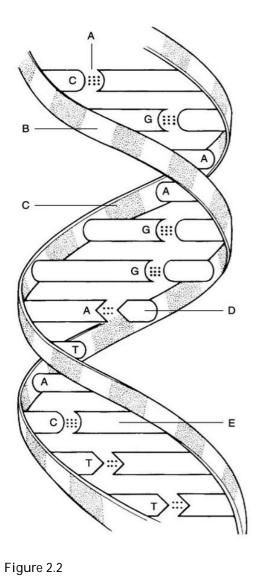

Answer: A

6) Polymer.

Answer: C

## 7) Tertiary (protein) structure.

Answer: B

Using Figure 2.2, match the following:

8) Deoxyribose sugar.

Answer: B

9) Thymine.

Answer: D

10) Guanine. Answer: E

11) Phosphate.

Answer: C

| 12)       | Hydrogen bonds. Answer: A   |                             |
|-----------|---|-----------------------------|
| МАТСНІ    | NG. Choose the item in column 2 that best mate  | ches each item in column 1. |
| Match the | following chemical bonds to the correct description:  |                             |
| 13)       | A bond in which electrons are shared unequally.   | A) Nonpolar covalent bond   |
|           | Answer: D   | B) Hydrogen bond            |
| 14)       | A bond in which electrons are completely lost or gained by the atoms  | C) Ionic bond               |
|           | involved. Answer: C   | D) Polar covalent bond      |
| 15)       | A bond in which electrons are shared equally.   |                             |
|           | Answer: A   |                             |
| 16)       | A type of bond important in tying different parts of the same molecule together into a three-dimensional structure. |                             |
|           | Answer: B   |                             |
| Match the | following particles to the correct description:   |                             |
| 17)       | Negatively charged subatomic particle.  | A) Proton                   |

Answer: D B) Neutron 18) Neutral subatomic particle. C) Atom Answer: B D) Electron

19) Smallest particle of an element that retains its properties.

Answer: C

20) Positively charged subatomic particle.

Answer: A

21) Subatomic particle having an AMU (Atomic Mass Unit) of zero.

Answer: D

| Match the | following:   |                      |
|-----------|--|----------------------|
| 22)       | Water.   | A) Compound          |
|           | Answer: A  | B) Solution          |
| 23)       | Saline.  |                      |
|           | Answer: B  | C) Suspension        |
| 24)       | Dry ice (frozen carbon dioxide).   |                      |
|           | Answer: A  |                      |
| 25)       | Blood.   |                      |
|           | Answer: C  |                      |
| Match the | following:   |                      |
| 26)       | Can be measured only by its effects on matter.   | A) Matter            |
|           | Answer: B  | B) Energy            |
| 27)       | Anything that occupies space and has mass.   | C) Mass              |
|           | Answer: A  | D) Weight            |
| 28)       | Although a man who weighs 175 pounds on Earth would be lighter on the moon and heavier on Jupiter, his would not be different. |                      |
|           | Answer: C  |                      |
| 29)       | Is a function of, and varies with, gravity.  |                      |
|           | Answer: D  |                      |
| Match the | following:   |                      |
| 30)       | Legs moving the pedals of a bicycle.  Answer: A  | A) Mechanical energy |

31) When the bonds of ATP are broken, energy is released to do cellular work.

Answer: C

32) Energy that travels in waves. Part of the electromagnetic spectrum.

Answer: A

33) Represented by the flow of charged particles along a conductor, or the flow of ions across a membrane.

Answer: B

## Match the following:

34) Protein structure achieved when alpha-helical or beta-pleated regions of the polypeptide chain fold upon one another to produce a compact ball-like, or *globular*, molecule.

Answer: B

35) The sequence of amino acids that form the polypeptide chain.

Answer: D

36) Protein structure represented by alpha-helices and beta-sheets.

Answer: A

37) Two or more polypeptide chains, each with its own tertiary structure.

Answer: C

## Match the following:

38) Usually, the first one or two letters of an element's name.

Answer: B

39) Number of protons in an atom.

Answer: A

40) Combined number of protons and neutrons in an atom.

Answer: C

- A) Radiant energy
- B) Electrical energy
- C) Chemical energy

- A) Secondary
- B) Tertiary
- C) Quaternary
- D) Primary

- A) Atomic number
- B) Atomic symbol
- C) Mass number of an element

## TRUE/FALSE. Write 'T' if the statement is true and 'F' if the statement is false.

|     | The atomic the left of it   |                           | any atom is equal to the number of electrons in its nucleus and is written as a subscript to mbol. |

| 77) | What is a chain of more than 50<br>A) triglyceride<br>Answer: D  | amino acids called?<br>B) nucleic acid   | C) polysaccharide  | D) protein               |  |  |
| 78) | What structural level is represe A) primary structure C) tertiary structure Answer: A  | nted by the sequence of amir   | no acids in a polypeptide chai<br>B) secondary structure<br>D) quaternary structure                              | in?                      |  |  |
| 79) | Carbohydrates and proteins are A) removal of a carbon atom B) removal of a water molect C) addition of a water molect D) addition of a carbon atom Answer: B   | between each two units<br>ule between each two units<br>ule between each two units                 | ilding blocks by the   |                          |  |  |
| 80) | <ul> <li>Which statement about enzymes is FALSE?</li> <li>A) Enzymes may use coenzymes derived from vitamins or cofactors from metallic elements.</li> <li>B) Enzymes may be damaged by high temperature.</li> <li>C) Most enzymes can catalyze millions of reactions per minute.</li> <li>D) Enzymes require contact with substrate in order to assume their active form.</li> <li>Answer: D</li> </ul> |  |  |                          |  |  |
| 81) | Which of the following stateme A) Chemical reactions progre B) Catalysts increase the rate C) Larger particles move fast D) Chemical reactions proceed Answer: C   | ess at a faster rate when the re<br>e of chemical reactions, some<br>fer than smaller ones and thu | imes while undergoing revel<br>s collide more frequently and   | rsible changes in shape. |  |  |
| 82) | Choose the answer that best des<br>A) a weak acid<br>C) common in the liver<br>Answer: D   | scribes HCO <sub>3</sub>   | B) a proton donor<br>D) a bicarbonate ion  |                          |  |  |
| 83) | Select which reactions will usual A) ADP + Pi to make ATP C) H <sub>2</sub> O + CO <sub>2</sub> to make H <sub>2</sub> C Answer: B   |  | chemical equilibrium in hun<br>B) glucose to CO <sub>2</sub> and H <sub>2</sub> O<br>D) glucose molecules joined |                          |  |  |

| 84) | What happens in redox reactio A) the organic substance that B) the reaction is uniformly C) both decomposition and C D) the electron acceptor is or | t loses hydrogen is usually re<br>reversible<br>electron exchange occur | educed   |                             |
|-----|---|---|--|-----------------------------|
|     | Answer: C   |   |  |                             |
| 85) | Which type of proteins can fun<br>A) enzyme<br>Answer: B  | nction as chemical messengers<br>B) communication                       | s or as receptors in the plasma<br>C) defensive            | a membrane?<br>D) transport |
| 86) | Which of the following does N A) mechanical work C) transport down their con Answer: D  |   | molecule? B) chemical work D) pigment structure            |                             |
| 87) | B) Three forms exist: DNA, C) RNA is a long, single-str   | randed molecule made up of  | he bases A, T, G, and C.                                   |                             |
| 88) | Which of the following is an ex<br>A) salt water<br>Answer: D   | cample of a suspension? B) cytosol                                      | C) rubbing alcohol   | D) blood                    |
| 89) | If the atomic mass of an elemen   | nt is 14 and the atomic numbe   | er is 6, which of the following                            | would describe this         |
|     | element? A) isotope Answer: A   | B) atom   | C) neutral   | D) ion                      |
| 90) | The four elements that make u A) nitrogen, hydrogen, calci C) sodium, potassium, hydr Answer: B   | um, sodium  | are  B) carbon, oxygen, hydroge D) carbon, oxygen, phospho | •                           |
| 91) | is fat soluble, production.   | ed in the skin on exposure to   | UV radiation, and necessary                                | for normal bone             |
|     | A) Vitamin D  | B) Vitamin K  | C) Vitamin A   | D) Cortisol                 |
|     | Answer: A   |   |  |                             |
| 92) | You notice that you cannot reaso blurred as to be unreadable. several days in a rack. What ty A) suspension   | There is no precipitant in the  |  |                             |
|     | Answer: D   | D) IIIMulo  | o, solution  | D) colloid                  |

| 93) Atom X has 17 proto<br>A) 7   | ons. How many electrons are<br>B) 3  | e in its valence shell (outermo<br>C) 5   | ost energy level)?<br>D) 10    |
|---|--|---|--------------------------------|
| Answer: A   |  |   |                                |
| 94) A high fever causes<br>when a protein dena<br>A) ionic bonds<br>C) non-polar cova | atures?  | dimensional structure and fu<br>B) hydrogen bo<br>D) polar covaler                |                                |
| Answer: B   |  |   |                                |
| 95) If atom X has an atom<br>A) 37 electrons<br>C) 74 protons<br>Answer: C            | mic number of 74 it would h  | nave which of the following?<br>B) 37 protons ar<br>D) 37 protons ar              |                                |
| B) The substance  | bon, 12 hydrogen, and 6 ox<br>is a colloid.<br>cium, 12 hydrogen, and 6 ox |   |                                |
| Aliswei. A  |  |   |                                |
| 97) An atom with 3 elec<br>A) 8<br>Answer: D  | trons in its outermost (valer<br>B) 3                                      | nce) shell may have a total of <sub>.</sub><br>C) 17                              | electrons altogether.<br>D) 13 |
|   |  |   |                                |
| 98) Which of the followi  | ng is a neutralization reaction  |   | ·NoCl · HaO                    |
| A) HCl → + Cl<br>C) NH <sub>3</sub> + H+ →N   |  | B) HCI + NaOH<br>D) NaOH →Na†   | =                              |
| Answer: B   | 114  | D) NaOTI Na   |                                |
| •   | <b>^</b> 0   |   |                                |
| Answer: B   |  |   |                                |
| B) an atom that sl<br>C) a molecule tha   | hares its valence electrons<br>t has both positive and nega                | nd acquires a net positive cha<br>ative charges<br>and acquires a net negative ch |                                |

Answer: A

| 101) | What does CH <sub>4</sub> mean?   |  |   |                          |
|------|---|--|---|--------------------------|
|      | <ul><li>A) There is one carbon and f</li><li>B) This was involved in a re</li><li>C) There are four carbon and</li></ul>                            | dox reaction.<br>d four hydrogen atoms.      |   |                          |
|      | D) This is an inorganic mole  | cule.  |   |                          |
|      | Answer: A   |  |   |                          |
| 102) | Amino acids joining together to A) reversible   | o make a peptide is a good e:<br>B) exchange | xample of a(n) reac<br>C) decomposition   | tion.<br>D) synthesis    |
|      | Answer: D   |  |   |                          |
| 103) | Which of the following is NOT<br>A) particle size<br>C) temperature   | considered a factor in influe                | encing a reaction rate?  B) time  D) concentration of reactar   | nts                      |
|      | Answer: B   |  |   |                          |
| 104) | Which property of water is der A) high heat of vaporization B) polar solvent properties C) cushioning D) high heat capacity E) reactivity Answer: A |  |   |                          |
|      |   |  |   |                          |
| 105) | Starch is a A) polysaccharide Answer: A   | B) triglyceride                              | C) monosaccharide   | D) disaccharide          |
| 104) | What is the ratio of fatty saids  | to alverral in trialvectides (n              | volutral fata\2   |                          |
| 106) | What is the ratio of fatty acids  A) 2:1  | B) 4:1                                       | C) 3:1  | D) 1:1                   |
|      | Answer: C   |  |   |                          |
| 107) | In a DNA molecule, the phosp<br>A) as a code<br>C) to bind the sugars to their<br>Answer: D   |  | B) as nucleotides D) to hold the molecular ba   | ackbone together         |
| 108) | When frying an egg, the protei<br>A) primary  | n albumin denatures and ma<br>B) tertiary    | nintains only its structure structu | ucture.<br>D) quaternary |
|      | Answer: A   |  |   |                          |
| 109) | Which of the following is chem A) sodium (atomic number 8 C) oxygen (atomic number 8 Answer: D  | 11)  | B) carbon (atomic number D) neon (atomic number 10  | •                        |
|      |   |  |   |                          |
| 110) | An atom with an atomic numb A) 24 protons   | er of 10 and a mass number B) 10 neutrons    | of 24 would have  C) 14 neutrons  | D) 14 electrons          |
|      | Answer: C   |  |   |                          |

| <ul><li>111) When DNA is replicated, it is necessary for the two strands to is most appropriate for holding the strands together in this v. A) hydrogen bonding</li><li>C) ionic bonding</li></ul> |  |  |   |                         |  |  |
|--|--|--|---|-------------------------|--|--|
|  | Answer: A  |  |   |                         |  |  |
|  | Lithium has an atomic number<br>A) one<br>Answer: A  | of 3. How many electrons ar<br>B) two          | e there in the outermost (vale<br>C) three                            | ence) shell?<br>D) zero |  |  |
|  | ATP →ADP + Pi is an example<br>A) exchange<br>Answer: C  | of a(n) reaction. B) synthesis                 | C) decomposition  | D) reversible           |  |  |
|  | An acid with a pH of 6 has<br>A) 100-fold more<br>Answer: C  |  | re water.<br>C) 10-fold more  | D) 100-fold fewer       |  |  |
|  | 115) A patient is hyperventilating. The "blowing off" of excessive carbon dioxide causes a decrease in blood H <sup>+</sup> concentration. How can the carbonic acid-bicarbonate buffer system function to correct this imbalance?  CO <sub>2</sub> + H <sub>2</sub> O ←H <sub>2</sub> CO <sub>3</sub> ←H <sup>+</sup> + HCO <sub>3</sub> <sup>-</sup> A) HCO <sub>3</sub> <sup>-</sup> binds with H <sup>+</sup> to form H <sub>2</sub> CO <sub>3</sub> and lower pH  B) H <sub>2</sub> CO <sub>3</sub> dissociates to form more H <sup>+</sup> and raise pH  C) H <sub>2</sub> CO <sub>3</sub> dissociates to form more H <sup>+</sup> and lower pH  D) HCO <sub>3</sub> <sup>-</sup> binds with H <sup>+</sup> to form H <sub>2</sub> CO <sub>3</sub> and raise pH  Answer: C |  |   |                         |  |  |
|  | Forming glycogen as energy st<br>A) anabolism<br>Answer: A   | orage in the liver is an examp<br>B) exergonic | ole of C) catabolism  | D) oxidation            |  |  |
|  | <ul> <li>117) Salivary amylase is an enzyme produced by the salivary glands that breaks down carbohydrates. What will happen to this enzyme as it follows the food into the stomach where the pH drops to 2.5? <ul> <li>A) The enzyme will denature but retain its function.</li> <li>B) The enzyme will denature and become inactive.</li> <li>C) The enzyme will continue to function as it remains unchanged in chemical reactions.</li> <li>D) The enzyme will assume an alternate form and catalyze additional reactions.</li> </ul> </li> <li>Answer: B</li> </ul>   |  |   |                         |  |  |
|  | With a family history of cardio<br>healthy"?<br>A) lard (pig fat)<br>C) margarine containing tra<br>Answer: D  |  | spread would be considered  B) butter containing butterf D) olive oil |                         |  |  |

| 119)    | Which of the following is <i>incorr</i> A) amino acid; protein C) eicosanoid; triglyceride  | rectly matched?   | B) nucleotide; nucleic acid<br>D) monosaccharide; carboh  | ydrate                   |
|---------|---|---|---|--------------------------|
|         | Answer: C   |   |   |                          |
| 120)    | Starch is the stored carbohydra A) glucose  | te in plants, while<br>B) triglyceride  | is the stored carbohydrate in<br>C) glycogen  | animals.<br>D) cellulose |
|         | Answer: C   |   |   |                          |
| 121)    | How many phosphates would<br>A) none<br>Answer: C   | ADP have attached to it? B) three   | C) two  | D) one                   |
| 122)    | Tendons are strong, rope-like s<br>would provide strength to a ter<br>A) albumin<br>C) collagen   |   | al muscle to bone. Which of t  B) molecular chaperone D) actin  | the following proteins   |
|         | Answer: C   |   | <i>D)</i> dot   |                          |
| 123)    | Phospholipids make up most o inside of a cell, which of the fol A) two back-to-back phosphol B) a single layer of phosphol C) a single layer of phosphol D) two back-to-back phosphol Answer: A | lowing phospholipid arrang<br>nolipid layers with the polar<br>lipids with the polar heads fa<br>lipids with the polar heads fa | ements makes the most sense<br>heads facing out on both side<br>acing outside the cell<br>acing inside the cell | e?<br>es                 |
| 124)    | What type of chemical bond can<br>A) hydrogen<br>C) polar covalent<br>Answer: D   | n form between an atom wit  | h 11 protons and an atom wi<br>B) non-polar covalent<br>D) ionic  | th 17 protons?           |
| SHORT A | ANSWER. Write the word or ph  | nrase that best completes ea  | ch statement or answers the   | question.                |
| 125)    | What happens when globular p  | proteins are denatured?   |   |                          |
| ,       | Answer: The active sites are de   |   |   |                          |
| 126)    | Explain the difference between  | potential and kinetic energy  | <i>I</i> .  |                          |
|         | Answer: Potential energy is ina action.   | active stored energy that has   | potential to do work. Kinetic   | energy is energy in      |
| 127)    | How can phospholipids form a  | film when mixed in water?   |   |                          |
|         | Answer: Phospholipids have b nonpolar end oriented  | oth polar and nonpolar ends<br>d in the opposite direction.   | s. The polar end interacts with   | h water, leaving the     |
| 128)    | What properties does water ha   | ve that make it a very versat   | ile fluid?  |                          |

Answer: High heat capacity, high heat of vaporization, polar solvent properties, reactivity, and cushioning.

129) What advantages does ATP have in being the energy currency molecule?

Answer: Its energy is easy to capture and store; it releases just the right amount of energy for the cell's needs so it is protected from excessive energy release. A universal energy currency is efficient because a single system can be used by all the cells in the body.

130) Explain why water is considered to have partial charges even though it is sharing electrons in a polar covalent bond.

Answer: Due to the electronegativity of oxygen, it pulls the shared electron more strongly than the hydrogen. As a result, the oxygen acquires a partial negative charge, and the hydrogens acquire a partial positive charge.

131) When a set of electrodes connected to a light bulb is placed in a solution of dextrose and a current is applied, the light bulb does not light up. When the same unit is placed in HCI, it does. Why?

Answer: HCl ionizes to form current-conducting electrolytes. Dextrose does not ionize, and therefore does not conduct current.

132) Describe the factors that affect chemical reaction rates.

Answer: Temperature increases kinetic energy and therefore the force of molecular collisions. Particle size: smaller particles move faster at the same temperature and therefore collide more frequently; also, smaller particles have more surface area given the same concentration of reactants. Concentration: the higher the concentration, the greater the chance of particles colliding. Catalysts increase the rate of the reaction at a given temperature. Enzymes are biological catalysts.

133) Protons and electrons exist in every atom nucleus except hydrogen. Is this statement true or false and why?

Answer: False. Hydrogen has one proton and one electron. It is the neutron, not the electron that can coexist in the nucleus and that hydrogen does not have.

134) A chemical bond never occurs between components of a mixture. Discuss this.

Answer: Mixtures come in three forms–solutions, colloids, and suspensions. Components of these mixtures always retain their original makeup and can be separated into their individual components; therefore, no chemical bonding has taken place.

135) All chemical reactions are theoretically reversible. Comment on this statement.

Answer: It is possible to reverse any reaction if the products are still present. Those that are only slightly exergonic are easily reversible. Some would require an enormous amount of energy to reverse. In the simple reaction Na + Cl →NaCl the amount of energy it takes to reverse table salt to chlorine gas and sodium metal is enormous. When glucose is oxidized the energy goes into bonds of ATP molecules which are then spent and thus the energy is not available to reform glucose.

136) What is the major difference between polar and nonpolar covalent bonds?

Answer: Polar bonds have an unequal sharing of electrons resulting in a slight negative charge at one end of the molecule and a slight positive charge at the other end. Nonpolar bonds have an equal sharing of electrons, resulting in a balanced charge among the atoms.

137) An amino acid may act as a proton acceptor or donor. Explain.

Answer: Amino acids have two components–a base group (proton acceptor) and an organic acid part (a proton donor). Some have additional base or acid groups on the ends of their R groups as well.

- 138) Name at least four things you know about enzymes.
  - Answer: 1. Most are proteins.
    - 2. They have specific binding sites for specific substrates.
    - 3. They lower the activation barrier for a specific reaction.
    - 4. The names often end in "Suffix: -ase."
    - 5. They can be denatured.
    - 6. They can be used again and again.
- 139) In the compound H<sub>2</sub>CO<sub>3</sub>, what do the numbers 2 and 3 represent?

Answer: The 2 indicates that there are two hydrogen atoms in the compound and the 3 indicates that there are three oxygen atoms in the compound.

140) Are all chemical reactions reversible? If not, why aren't they all reversible?

Answer: All chemical reactions are theoretically reversible, but only if the products are not consumed and enough energy is available for the reaction.

141) If all protons, electrons, and neutrons are alike, regardless of the atom considered, what determines the unique properties of each element?

Answer: Atoms of different elements are composed of different numbers of protons, electrons, and neutrons.

- ESSAY. Write your answer in the space provided or on a separate sheet of paper.
  - 142) Mrs. Mulligan goes to her dentist and, after having a couple of cavities filled, her dentist strongly suggests that she reduce her intake of sodas and increase her intake of calcium phosphates in the foods she eats. Why?

Answer: Sodas are strong acids that can reduce bone and tooth salts. Calcium phosphate makes teeth hard and therefore more resistant to tooth decay.

143) Although his cholesterol levels were not high, Mr. Martinez read that cholesterol was bad for his health, so he eliminated all foods and food products containing this molecule. He later found that his cholesterol level dropped only 20%. Why did it not drop more?

Answer: Cholesterol is produced by the liver, in addition to being ingested in foods.

144) How can DNA be used to "fingerprint" a suspect in a crime?

Answer: The DNA of a person is unique to that individual. By obtaining the DNA from nucleated cells from the crime scene (e.g., blood, semen, other body tissues), enzymes may be used to break up the DNA into fragments. Because nearly everyone's DNA is different, it also breaks up into fragments differently. When the fragments are separated, they form patterns even more unique than fingerprint patterns. A match of suspect and crime scene DNA is strong evidence.

145) Why is it possible for us to drink a solution that contains a mixture of equal concentration of a strong acid and a strong base, either of which, separately, would be very caustic?

Answer: When an acid and base of equal strength are mixed, they undergo a displacement (neutralization) reaction to form water and a salt.

146) A 65-year-old patient came to the emergency room with complaints of severe heartburn unrelieved by taking a "large handful" of antacids. Would you expect the pH to be high or low? Explain why.

Answer: You would expect a high pH. Taking antacids will neutralize the acidic stomach. Taking a "handful" of antacids can cause an alkaloid state. Certain drugs, such as corticosteroids and antacids that contain baking soda, will lead to metabolic alkalosis.

- 147) A 22-year-old female college student is stressed out due to final exams and begins to hyperventilate. This means she is exhaling too much carbon dioxide. As a result, the pH of the blood will become too basic creating a homeostatic imbalance. Her friend hands her a paper bag and instructs her to inhale and exhale into the bag. Breathing in the bag helps to replace the lost carbon dioxide lowering the pH back to normal levels. Which buffer system in the body will be involved in this reaction?
  - Answer: The bicarbonate buffer system is going to be involved in this situation. In this buffer system, the weak acid is carbonic acid, which is formed from the reaction between carbon dioxide and water. The body responds to an increase in blood pH by shifting the equation to the left, causing carbonic acid to dissociate into bicarbonate and protons. These protons will bring the rising pH back to a normal level.
- 148) Brenda is a 26-year-old female who is being discharged from the hospital after a vaginal delivery of an 8-pound healthy infant. Brenda is instructed by the nurse to eat a diet high in fiber and to drink 8 glasses of water per day to prevent constipation. Explain the role of fiber and water to promote defecation.
  - Answer: Cellulose is a polysaccharide found in all plant products that adds bulk to the diet to promote feces through the colon. Water acts as a lubricating liquid within the colon, which eases feces through the bowel.
